

There's a better way to distribute your eLearning content.

Whether training content is your primary business or you provide content to customers as a service to a larger product offering, you likely spend a good deal of time delivering courses individually to each client LMS.

Our content distribution solutions fix that problem, allowing you to manage your training content (whether SCORM, xAPI, cmi5 or AICC) from a single, central location. This streamlines your course administration process across multiple systems, making it easier to release, manage and understand what happens to your training.

Manage your training content from a single, central location and share access with other systems

The benefits of centrally hosting your courses

Ensure
up-to-date
content

Enforce course
licenses and
control access

Decrease
administrative
burdens

Make strategic
decisions using
meaningful analytics

Support multiple
languages
easily

The SANS Institute uses Content Controller to deliver upwards of one million training modules per week that can be easily updated and tracked.

The challenge

As the global leader in information cyber security training and certification, the SANS Institute's programs help more than 165,000 information security professionals and six million knowledge workers worldwide. However, SANS's delivery and management of training content within multiple LMSs was an extremely time consuming, manual effort. On average, four people spent 600 days per year deploying training in 28 languages to 70 client LMSs and SANS lacked insight into content usage patterns. SANS found that if clients were charged accurately for their learners, revenues could increase annually by an estimated 20%

The solution

To solve these problems, the SANS Institute uses Content Controller. The new implementation allows SANS to centrally host their content in order to seamlessly deliver the latest, most accurate content to learners and streamline license administration.

The results

Since using Content Controller, SANS has seen:

- **A 90% reduction** in time spent updating existing content, **saving \$100,000 in employee costs** per year.
- A **significant increase in revenues** by ensuring customers are paying for the correct number of learners.
- Efficient deployment of **28 languages** as a single course.
- **70 LMSs across 600 customers** supported with the ability to easily deploy to more.
- Access to **real-time data** of usage across their course library and customer base.

Select the eLearning delivery solution that's right for you:

Content Controller

An application that lets you centrally host your content and easily distribute it to third-party systems.

Rustici Dispatch

Integrated software that allows you to centrally manage content within your existing application.

Rustici
Cross Domain

Integrated software that helps you distribute non-standardized, dynamically generated content.
